

Lakeside Software Introduces SysTrack 3.5

Monday April 10, 2006, 8:00 am ET

New Release Delivers Extensive New Feature Set, Highly Scalable Architecture

KEEGO HARBOR, Michigan, April 10 – Lakeside Software® today announced it has released SysTrack® 3.5 to production. The new software, representing over two years of engineering and architectural improvements, boasts a wide variety of new features and extends scalability to the 100,000 system range.

SysTrack provides easy-to-use management capabilities for Microsoft® Windows desktops, servers and terminal servers over a TCP/IP-based, Internet friendly architecture. Through the use of local databases organized into a logical hierarchy, SysTrack achieves scalability suitable for the largest enterprises while consuming a minimum amount of network traffic. Built-in support for authentication, encryption and role-based security helps achieve the level of security required in such large installations. SysTrack's unique architecture is protected by a United States patent issued in 2005.

SysTrack provides real-time monitoring and alerting for system, disk and network indicators, service and application management, user auditing, application resource analysis, capacity planning, event log monitoring and management, memory leak detection, application fault detection, scripting, response time measurement, historical graphing and trending, root cause analysis, event correlation, inventory and change management, software usage measurement and reporting, user web tracking, a blackbox data recorder and other features. Integration of these features in a common package minimizes administrator training requirements and installation time.

SysTrack includes remote deployment tools and can be installed in a moderate sized organization in less than an hour. Unlike other management tools, SysTrack requires minimal setup in order to achieve full functionality of the product.

Lakeside Software, Inc.

Since 1997, Lakeside Software has been a leader in management solutions for the Windows marketplace. SysTrack is the easiest to use, most complete way to monitor and tune application performance. SysTrack combines comprehensive system monitoring capabilities with inventory tracking and sophisticated statistical analysis for applications and users to create a total management solution.
